

New snow instability on Ross Peak

Date

Wed, 02/05/2025 - 10:30

Activity

Skiing

Skied the East Meadows of Ross Peak, had about 4 inches of fresh snow come down in 2 hours. Lots of cracking and small storm slabs remote triggering on small rollovers on the way out. This was a small remote trigger next to the skin track, about 20 feet wide by 10 feet long. New wet snow seemed especially poorly bonded with the old snow below 7000 feet where the snow fell on very cold snow from affected by the inversion.

Region

Bridger Range

Location (from list)

Ross Peak

Observer Name

Koby Gordon
